

The automotive industry has to account for what is called traced value of certain raw materials within a BOM. Below is from CBP's website as to what tracing is.

**Tracing**

Tracing ensures greater accuracy in calculating the regional value content by tracking the value of major automotive components and subassemblies imported into the NAFTA region, so that the non-originating value of these components and subassemblies is reflected in the regional value-content calculation of the motor vehicle or in auto parts destined for original equipment use. This significantly limits the phenomenon known as "roll-up" and "roll-down," whereby the full value of goods is counted as originating or non-originating content even though they may contain a mix of originating and non-originating materials. For those components subject to tracing, any non-originating (non-NAFTA) value will remain non-originating through all stages of assembly to the time of calculation of the regional value content of the motor vehicle (or auto part destined for original equipment use). The value of traceable automotive components is determined at the time the non-originating components are received by the first person in Canada, Mexico or the United States who takes title to them, after importation from outside the NAFTA region. The value of the components will be determined in accordance with standard valuation norms and will generally be the transaction value. Certain costs must be added to the transaction value if not included in it (e.g., packing, selling commissions).

The tracing list tariff numbers are found in Annex 403.1

*\* Below is a compilation of several online resources, including Schaeffler USA's list, compared against the valid, active HTS numbers in the 2011 through 2017 tariffs \**
